WHAT DID THE RESEARCHERS INVESTIGATE?

- Science capital describes students' science-related resources, but online learning adds conditions such as device access and digital participation.
- The authors developed a questionnaire on online science capital from Bourdieu's theory and Archer et al.'s framework.
- It was completed by 364 Taiwanese junior high school students alongside two aspiration items.

Chen and Tsai (2026) · Research in Science & Technological Education · doi.org/10.1080/02635143.2026.2754282

WHAT DID THEY FIND?

- The analyses gave preliminary evidence for eight sub-dimensions of online science capital.
- Males scored higher than females in online science self-efficacy and online science investments.
- Online science capital was positively associated with science aspirations; learning attitude and self-efficacy remained significant predictors of study and job aspirations.
